Teacher packs in Experimental Science

PHY Pack 10

Determination of the specific heat capacity of a solid by the method of mixtures

Pack contents:

A. Teacher’s Guide
B. Students Guide
C. Assessment – Student’s sheet
D. Extensions to experiments
E. Links to other packs
F. Health and Safety

Curriculum areas covered:

Heat energy
Title: Determination of the specific heat capacity of a solid by the method of mixtures

Target group: Diploma in Basic Education Students

Also suitable for: B.Ed. (Basic Education)

Duration of Activity: 50 minutes plus discussion time

Learning outcomes:

At the end of the lesson the student should be able to

<table>

A. Teacher’s Guide

Overview
Students are asked to find the specific heat capacity of a metal ball and are provided with the following apparatus:

- Solid (e.g. metal ball) of reasonable size
- Calorimeter with an insulated outer jacket and stirrer
- Thermometer (reading up to 0.1°C)
- Heater
- Thread
- Sensitive balance
- Beaker

Aim
This experiment is to enable students to see how experimental data can be used to establish relationships among measured quantities, and use the relationship to make predictions outside the range of direct measurement.

Practical Skills to be developed
1. Application of scientific method including observation, measuring, collection, recording and tabulating data.
2. Use of significant figures.
3. Setting up apparatus for experiment.
5. Team work and oral communication.

Advice to Tutor
A. Measured quantities should be repeated and averaged
B. Encourage student to do independent work, one at a time if in groups.
C. The calorimeter should be kept in its insulating jacket.
D. Thermal equilibrium should be achieved before the final temperature is taken.
E. Create time to discuss the theory behind the experiment.

Sample Assessment Questions with Answers

1. Define heat capacity and specific heat capacity of a substance. (KN2)

   **Answer:** Heat capacity is the quantity of heat required to change the temperature of a body by one degree. It is expressed in joule per kelvin (J/K) in S I units.

   Specific heat capacity is the quantity of heat required to change the temperature of one kilogram of a body by one degree. It is expressed in joule per kilogram per kelvin (Jkg⁻¹ K⁻¹) in S I units.
2. Why is it important to transfer the hot metal ball quickly into the calorimeter as required in the experiment? (KS4)

   **Answer:** To minimize heat loss to the environment.

3. Why is it necessary to hold the metal ball briefly in the steam above the boiling water? (KS2)

   **Answer:** Two reasons-:

   (i). To allow the water on the metal ball to drop and

   (ii). To maintain constant temperature with the steam.

4. What mode of heat transfer takes place in this experiment? (CS3)

   Answer: Heat transfer is mainly by conduction.
B. Student Guide

Purpose
To determine the specific heat capacity of a solid by the method of mixtures

Background
The heat capacity $C$ of an object (e.g. metal ball) is the proportionality constant between an amount of heat and the change in temperature that the heat produced in the object. Thus, $Q = C(T_f - T_i)$, where $T_i$ and $T_f$ are the initial and final temperatures of the object. Two objects made of the same material, say marble, will have heat capacities proportional to their masses. It is therefore convenient to define a “heat capacity per unit mass” or specific heat $c$ that refers not to an object but to unit mass of the material of which the object is made and is expressed in joule per kilogram per Kelvin (J kg$^{-1}$K$^{-1}$). The specific heat capacity equation then becomes $Q = mc(T_f - T_i)$, where $m$ is the mass of the object.

Equipment/ Materials/ Apparatus
You are provided with the following:
- Solid (e.g. metal ball) of reasonable size
- Calorimeter with an insulation, outer jacket and stirrer
- Thermometer (reading up to 0.1°C)
- Heater
- Thread
- Sensitive balance
- Beaker

You are to determine the specific heat capacity of the metal ball.

![Figure 1: Experimental Setup for determining the specific heat capacity of a metal ball.](image-url)
**Instructions:**

Water should be collected and placed near calorimeter 1 hour before the experiment in order to ensure the same temperature.

1. You will work on individual basis. However, if the apparatus are not enough, then you will work in small groups.
2. You should set up the experiment as shown in the diagram above.
3. Weigh the metal ball and record its mass.
4. You should suspend the metal ball in water contained in a beaker.
5. You should heat the beaker with the water until it boils for about 15 minutes.
6. While heating the solid, weigh the calorimeter empty, and record the mass.
7. Weigh the calorimeter again when two-thirds full of water, and record the mass.
8. Take the temperature of the water in the calorimeter placed in its outer jacket.
9. When the solid has been in the boiling water for about 15 minutes, you should remove it gently, hold it briefly in the steam above the water and quickly transfer it into the water in the calorimeter.
10. You should stir continuously and record the final temperature of the mixture.
11. Record your observations and calculate the specific heat capacity of the metal ball.
12. Record your observations as follows:

   i. Mass of solid \( m_1 \) =
   
   ii. Mass of empty calorimeter \( m_2 \) =
   
   iii. Mass of calorimeter + water \( m_3 \) =
   
   iv. Initial temperature of water in calorimeter \( T_i \) =
   
   v. Temperature of the hot solid \( 100\, ^\circ C \) =
   
   vi. Temperature of mixture \( T_f \) =
   
   vii. Rise in temperature of water and calorimeter \( (T_f - T_i)\, ^\circ C \) =
   
   viii. Fall in temperature of hot solid \( (100 - T_i)\, ^\circ C \) =

13. Calculate the specific heat capacity \( c \) of the solid as show below:

   Let S.H.C of solid \( = c \)
   
   Also, let S.H.C of calorimeter \( = c_1 \)
   
   And let S.H.C of water \( = c_w \)
   
   Heat lost by solid \( = m_1c(100 - T_f) \)
   
   Heat gained by water \( = (m_3 - m_2)c_w(T_f - T_i) \)
   
   Heat gained by calorimeter \( = m_2c_1(T_f - T_i) \)
   
   Total heat gained \( = (T_f - T_i)[(m_3 - m_2)c_w + m_2c_1] \)

   But heat lost \( = m_1c(100 - T_f) \)

   \[ c = \frac{(T_f - T_i)[(m_3 - m_2)c_w + m_2c_1]}{m_1(100 - T_f)} \]
Conclusion
The specific heat capacity of the object = …….
C. Assessment – Student’s sheet

On completion of the experiment, you should answer the following questions:

1. Define heat capacity and specific heat capacity of a substance.  (KN2 )

2. Why is it important to transfer the hot metal ball quickly into the calorimeter as required in the experiment?  (KS4)

3. Why is it necessary to hold the metal ball briefly in the steam above the boiling water?  (KS2)

4. What mode of heat transfer takes place in this experiment?  (CS3 )
D. Extensions to experiment
1. A similar procedure can be used to determine the specific heat capacity of liquids.

E. References and Other Useful Links

F. Health and Safety
1. When boiling the metal ball, be careful you do not spill the hot water on your skin and do not handle the hot metal ball in your palm.
